

## External dependencies - Krogkollen

- Android SDK api 14+
- Java 1.7 SE development environment
- Google Play Services library - google-play-services\_lib
- google-play-services.jar
- Parse-1.3.5.jar
- android-support-v4.jar

### Google Play Services

The application rely on both the Google Maps visual elements aswell as the location service, therefore we need the Google Play Services library.

### Parse

Parse is a full backend stack for all kinds of application. Krogkollen uses this backend to store all the cloud data. The library is of course used to connect and manage the data from the server in the application.

### Android Support

Used to add support for Android API level 4 features, activity navigation methods and some action bar widget animations (Action bar was added in api level 14 but we apply some animations from the earlier apis in the action bar).
