Known issues - Krogkollen

- In map view: If you after tilting the map to the fullest start moving the map fast, the application will crash. We know which line of code causes this, unfortunately the method to which it belongs isn't ours and thus we don't want to change it. A simple fix would be to disable the tilt function, but we don't feel like it's a problem that will occur frequently and thus it is not prioritized.

- Application: If the user leaves the application on while their phone falls asleep, let's it sleep for a while and then wakes it the application might crash. We do not know how to fix this since it is very difficult to replicate this error over all. It also seems to be practically impossible to replicate this error while the phone is connected to a computer by USB, and if it's not connected we can't log exceptions etc.

- In list view: The distance showing in each list element will not update if the real distance is changed.

- In map view: If there a two markers laying on top of each other and you click the one that is on top, you will get to the pub laying under.

- In list view: If you dont have any favorites the page will just be empty, if we had more time we would like to have it saying something like "You have no favorites". But this was prioritized down due to other issues.
